

Индивидуальный проект

Этап 2. Установка DVWA

Мухин Тимофей

22.03.2025

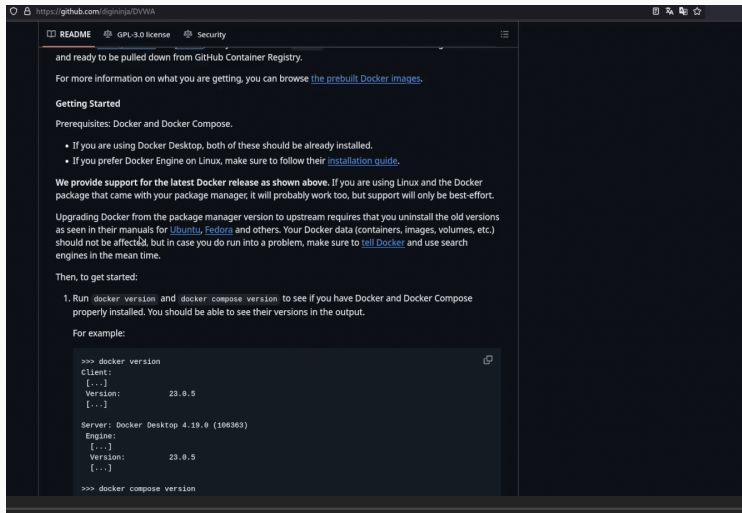

Российский университет дружбы народов, Москва, Россия

Цель работы

Установить DVWA в гостевую систему к Kali Linux. Репозиторий:
<https://github.com/digininja/DVWA>.

Выполнение работы

Изучаем информацию по установке DVWA в docker контейнер

and ready to be pulled down from GitHub Container Registry.

For more information on what you are getting, you can browse [the prebuilt Docker images](#).

Getting Started

Prerequisites: Docker and Docker Compose.

- If you are using Docker Desktop, both of these should be already installed.
- If you prefer Docker Engine on Linux, make sure to follow their [installation guide](#).

We provide support for the latest Docker release as shown above. If you are using Linux and the Docker package that came with your package manager, it will probably work too, but support will only be best-effort.

Upgrading Docker from the package manager version to upstream requires that you uninstall the old versions as seen in their manuals for [Ubuntu](#), [Fedora](#) and others. Your Docker data (containers, images, volumes, etc.) should not be affected, but in case you do run into a problem, make sure to [tell Docker](#) and use search engines in the mean time.

Then, to get started:

1. Run `docker version` and `docker compose version` to see if you have Docker and Docker Compose properly installed. You should be able to see their versions in the output.

For example:

```
>>> docker version
Client:
[...]
Version:      23.0.5
[...]
```

```
Server: Docker Desktop 4.10.0 (106363)
Engine:
[...]
```

```
Version:      23.0.5
[...]
```

```
>>> docker compose version
```

Устанавливаем Docker и Docker-compose на Kali Linux

KALI

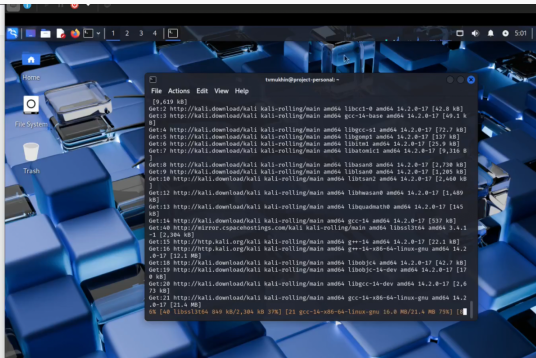

Installing Docker on Kali Linux

Table of Contents

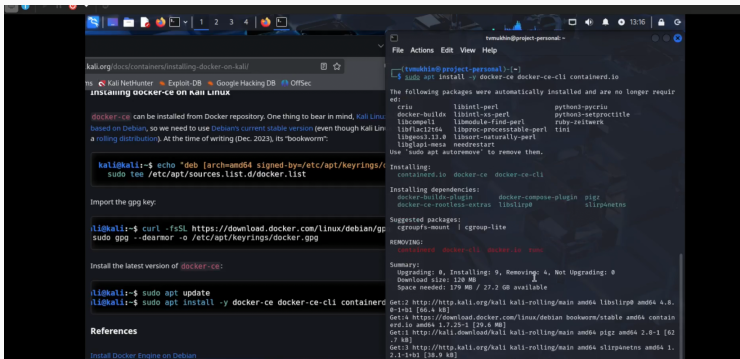

To install Docker on Kali you need to remember that there is already a package named "docker", therefore Docker has to be installed under a different name. If you install **docker** you will not end up with the container version. The version we will be installing is named **docker.io**. All commands are the same however, so running **docker** on the command line will be the appropriate command:

```
kaligkali:~$ sudo apt update
kaligkali:~$ sudo apt install -y docker
kaligkali:~$ sudo systemctl enable docker
kaligkali:~$ docker
kaligkali:~$
```

You can now get started with using docker, with **sudo**. If you want to add yourself to the docker group to use

Устанавливаем Docker и Docker-compose на Kali Linux

The screenshot shows a Kali Linux desktop environment. On the left, a web browser displays the Docker installation guide for Kali Linux. The terminal on the right shows the execution of commands to install Docker and Docker-compose.

Web Browser Content:

- URL: kali.org/docs/containers/installing-docker-on-kali/
- Navigation: Kali NetHunter, Exploit-DB, Google Hacking DB, OffSec
- Section: Installing docker-ce on Kali Linux
- Text: `docker-ce` can be installed from Docker repository. One thing to bear in mind, Kali Linux is based on Debian, so we need to use Debian's current stable version (even though Kali Linux is a rolling distribution). At the time of writing (Dec. 2023), its "bookworm".
- Code Block:

```
kali@kali:~$ echo "deb [arch=amd64 signed-by=/etc/apt/keysrings/kali.gpg] http://download.docker.com/linux/debian/gpg" | sudo tee /etc/apt/sources.list.d/docker.list
```
- Text: Import the gpg key:
- Code Block:

```
kali@kali:~$ curl -fsSL https://download.docker.com/linux/debian/gpg | sudo gpg --dearmor -o /etc/apt/keysrings/docker.gpg
```
- Text: Install the latest version of `docker-ce`:
- Code Block:

```
kali@kali:~$ sudo apt update
kali@kali:~$ sudo apt install -y docker-ce docker-ce-cli containerd.io
```
- Section: References
- Text: Install Docker Engine on Debian

Terminal Content:

```
tmux@kali:~$ sudo apt install -y docker-ce docker-ce-cli containerd.io
The following packages were automatically installed and are no longer required:
  criu libintl-perl python3-pycurl
  docker-buildx libintl-as-perl python3-setproctitle
  libcompel1 libmodule-find-perl python3-zellwark
  libflac12t64 libproc-processtable-perl tini
  libgens1.13.0 libsort-naturally-perl
  liblapl-mesa needrestart
Use 'sudo apt autoremove' to remove them.

Installing:
  containerd.io docker-ce docker-ce-cli

Installing dependencies:
  docker-buildx-plugin docker-compose-plugin pigz
  docker-ce-rootless-extras libslirp0 slirp4netns

Suggested packages:
  cgroupfs-mount | cgroup-lite

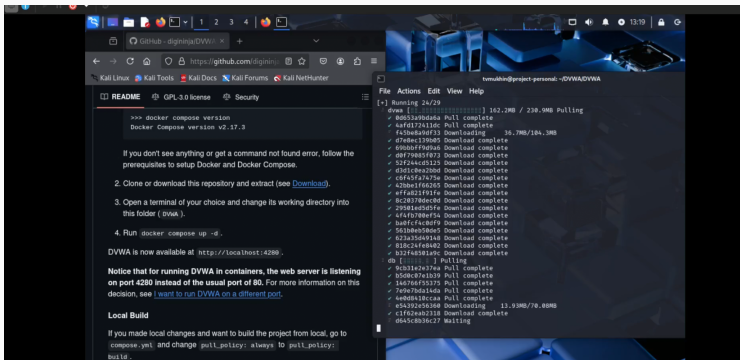

REMOVING:
  containerd.io docker-ce-cli docker.io tomcat

Summary:
  Upgrading: 0, Installing: 9, Removing: 4, Not Upgrading: 0
  Download size: 120 MB
  Space needed: 179 MB / 27.2 GB available

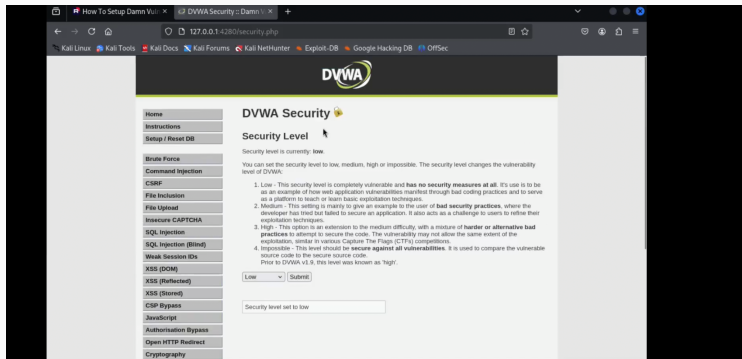

Get:2 http://kali.org/kali kali-rolling/main amd64 libslirp0 amd64 4.8.0-1+b1 [66.4 kB]
Get:4 https://download.docker.com/linux/debian bookworm/stable amd64 containerd.io amd64 1.7.25-1 [29.6 MB]
Get:1 http://kali.download/kali kali-rolling/main amd64 pigz amd64 2.0-1 [62.7 kB]
Get:3 http://kali.org/kali kali-rolling/main amd64 slirp4netns amd64 1.2.1-1+b1 [38.9 kB]
```

Выполнение работы

Клонируем репозиторий с DVWA и запускаем контейнер с DVWA. Будет доступен веб-интерфейс на localhost

Первичный запуск настройка DVWA

Вывод

В ходе выполнения этапа 2 индивидуального проекта было установлено DVWA
